#### t.test

Imagine we have run 1000 experiments (rows), each of which collects data on 50 individuals (columns). The first 25 individuals in each experiment are assigned to group 1 and the rest to group 2.

The goal is to calculate the t-statistic for each experiment comparing group 1 to group 2.

```
1 m = 1000
 2 n = 50
 3 \quad X = matrix(
     rnorm(m * n, mean = 10, sd = 3),
     ncol = m
 5
 6 ) |>
     as.data.frame() |>
 7
     set names(paste0("exp", seq len(m)))
 8
 9
     mutate(
10
       ind = seq len(n),
     group = rep(1:2, each = n/2)
11
     ) |>
12
     as tibble() |>
13
     relocate(ind, group)
14
15 X
```

```
# A tibble: 50 × 1,002

# Parallelization

### parallel

Part of the base packages in R

- tools for the forking of R processes (some functions do not work on Windows)
- Core functions:
  - detectCores
  - pvec
  - mclapply
  - mcparallel & mccollect

#### detectCores

Surprisingly, detects the number of cores of the current system.

```
1 detectCores()
```

[1] 10

#### pvec

#### Parallelization of a vectorized function call

```
1 system.time(pvec(1:1e7, sqrt, mc.cores = 1))
      system elapsed
user
0.095
      0.011 0.106
       1 system.time(pvec(1:1e7, sqrt, mc.cores = 4))
      system elapsed
user
               0.242
0.167
       0.126
       1 system.time(pvec(1:1e7, sqrt, mc.cores = 8))
      system elapsed
user
0.089
      0.170
               0.155
       1 system.time(sqrt(1:1e7))
      system elapsed
user
0.018
     0.016
              0.034
```

### pvec - bench::system\_time

```
process real
60.5ms 59.7ms

1 bench::system_time(pvec(1:1e7, sqrt, mc.cores = 1))

process real
164ms 203ms

      system elapsed
user
0.312
       0.088
               0.251
        1 system.time(unlist(mclapply(1:10, function(x) rnorm(1e6), mc.cores = 4)))
      system elapsed
user
0.327
       0.088
              0.164
        1 system.time(unlist(mclapply(1:10, function(x) rnorm(1e6), mc.cores = 8)))
      system elapsed
user
0.331
        0.138
                0.162
        1 system.time(unlist(mclapply(1:10, function(x) rnorm(1e6), mc.cores = 10)))
      system elapsed
user
0.369
        0.159
                0.183
```

## mcparallel

Asynchronously evaluation of an R expression in a separate process

```
1 m = mcparallel(rnorm(1e6))
          2 n = mcparallel(rbeta(1e6,1,1))
          3 o = mcparallel(rgamma(1e6,1,1))
          1 \, str(m)
List of 2
 $ pid: int 53890
 $ fd : int [1:2] 4 7
 - attr(*, "class")= chr [1:3] "parallelJob" "childProcess" "process"
          1 str(n)
List of 2
 $ pid: int 53891
 $ fd : int [1:2] 5 9
 - attr(*, "class")= chr [1:3] "parallelJob" "childProcess" "process"
```

#### mccollect

#### Checks mcparallel objects for completion

```
1 str(mccollect(list(m,n,o)))
List of 3
$ 53890: num [1:1000000] -0.144 0.786 2.704 0.157 -0.558 ...

# doMC & foreach

### doMC & foreach

Packages by Revolution Analytics that provides the foreach function which is a parallelizable for loop (and then some).

- Core functions:
  - registerDoMC
  - foreach, %dopar%, %do%

### registerDoMC

Primarily used to set the number of cores used by foreach, by default uses options ("cores") or half the number of cores found by detectCores from the parallel package.

```
1 options("cores")
$cores
NULL
          1 detectCores()
[1] 10
          1 getDoParWorkers()
[1] 1
            registerDoMC(4)
          2 getDoParWorkers()
[1] 4
```

#### foreach

A slightly more powerful version of base for loops (think for with an lapply flavor). Combined with %do% or %dopar% for single or multicore execution.

```
1 for(i in 1:10) {
2   sqrt(i)
3 }
```

```
1 foreach(i = 1:5) %do% {
2   sqrt(i)
3 }
```

```
[[1]]
[1] 1

[[2]]
[1] 1.414214

[[3]]
[1] 1.732051

[[4]]
[1] 2

[[5]]
[1] 2.236068
```

### foreach - iterators

foreach can iterate across more than one value, but it doesn't do length coercion

```
1 foreach(i = 1:5, j = 1:5) %do% {
                                                                  1 foreach(i = 1:5, j = 1:2) %do% {
              sqrt(i^2+j^2)
                                                                  2 sqrt(i^2+j^2)
          3 }
                                                                  3 }
[[1]]
                                                       [[1]]
[1] 1.414214
                                                       [1] 1.414214
[[2]]
                                                       [[2]]
[1] 2.828427
                                                       [1] 2.828427
[[3]]
[1] 4.242641
[[4]]
[1] 5.656854
[[5]]
[1] 7.071068
```

## foreach - combining results

```
1 foreach(i = 1:5, .combine='c') %do% {
             sqrt(i)
         3 }
[1] 1.000000 1.414214 1.732051 2.000000 2.236068
         1 foreach(i = 1:5, .combine='cbind') %do% {
         2 sqrt(i)
         3 }
    result.1 result.2 result.3 result.4 result.5
[1,]
           1 1.414214 1.732051 2 2.236068
         1 foreach(i = 1:5, .combine='+') %do% {
         2 sqrt(i)
         3 }
```

[1] 8.382332

## foreach - parallelization

Swapping out %do% for %dopar% will use the parallel backend.

```
1 registerDoMC(4)
        2 system.time(foreach(i = 1:10) %dopar% mean(rnorm(1e6)))
       system elapsed
user
0.298
       0.022
                0.108
        1 registerDoMC(8)
        2 system.time(foreach(i = 1:10) %dopar% mean(rnorm(1e6)))
       system elapsed
user
0.303
       0.038
                0.078
        1 registerDoMC(10)
        2 system.time(foreach(i = 1:10) %dopar% mean(rnorm(1e6)))
       system elapsed
user
                0.066
0.324
       0.050
```

Sta 323 - Spring 2024

#### furrr / future

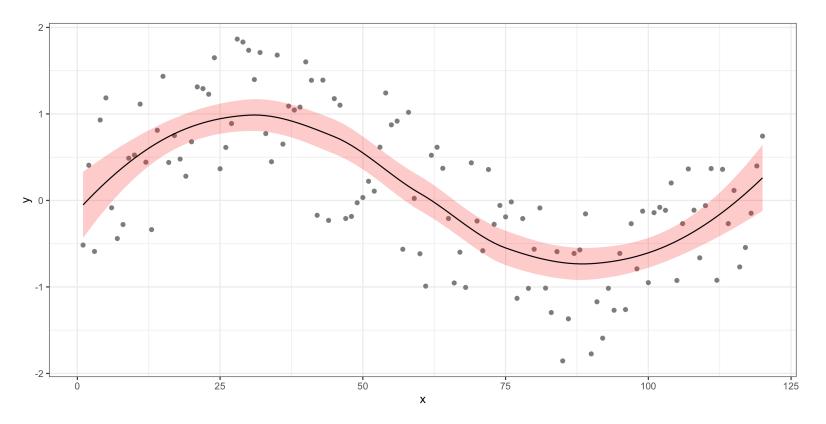

```
1 system.time( purrr::map(c(1,1,1), Sys.sleep) )
      system elapsed
user
0.000
       0.000
               3.012
       1 system.time( furrr::future_map(c(1,1,1), Sys.sleep) )
       system elapsed
user
       0.006
              3.084
0.050
        1 future::plan(future::multisession) # See also future::multicore
        2 system.time( furrr::future map(c(1,1,1), Sys.sleep) )
      system elapsed
user
0.188
       0.004
               1.445
```

# **Example - Bootstraping**

Bootstrapping is a resampling scheme where the original data is repeatedly reconstructed by taking a samples of size n (with replacement) from the original data, and using that to repeat an analysis procedure of interest. Below is an example of fitting a local regression (loess) to some synthetic data, we will construct a bootstrap prediction interval for this model.

```
1  set.seed(3212016)
2  d = data.frame(x = 1:120) |>
3     mutate(y = sin(2*pi*x/120) + runif(length(x),-1,1))
4
5  l = loess(y ~ x, data=d)
6  p = predict(l, se=TRUE)
7
8  d = d |> mutate(
9   pred_y = p$fit,
10   pred_y_se = p$se.fit
11 )
```

```
1  ggplot(d, aes(x,y)) +
2   geom_point(color="gray50") +
3   geom_ribbon(
4   aes(ymin = pred_y - 1.96 * pred_y_se,
5      ymax = pred_y + 1.96 * pred_y_se),
6   fill="red", alpha=0.25
7  ) +
8   geom_line(aes(y=pred_y)) +
9   theme_bw()
```

# **Bootstraping Demo**

#### What to use when?

Optimal use of parallelization / multiple cores is hard, there isn't one best solution

- Don't underestimate the overhead cost
- Experimentation is key
- Measure it or it didn't happen
- Be aware of the trade off between developer time and run time

# **BLAS and LAPACK**

# Statistics and Linear Algebra

An awful lot of statistics is at its core linear algebra.

#### For example:

• Linear regession models, find

$$\hat{\beta} = (X^T X)^{-1} X^T y$$

- Principle component analysis
  - Find T = XW where W is a matrix whose columns are the eigenvectors of  $X^TX$ .
  - Often solved via SVD Let  $X = U\Sigma W^T$  then  $T = U\Sigma$ .

# Numerical Linear Algebra

Not unique to Statistics, these are the type of problems that come up across all areas of numerical computing.

- Numerical linear algebra  $\neq$  mathematical linear algebra
- Efficiency and stability of numerical algorithms matter
  - Designing and implementing these algorithms is hard
- Don't reinvent the wheel common core linear algebra tools (well defined API)

#### **BLAS and LAPACK**

Low level algorithms for common linear algebra operations

#### **BLAS**

- Basic Linear Algebra Subprograms
- Copying, scaling, multiplying vectors and matrices
- Origins go back to 1979, written in Fortran

#### LAPACK

- Linear Algebra Package
- Higher level functionality building on BLAS.
- Linear solvers, eigenvalues, and matrix decompositions
- Origins go back to 1992, mostly Fortran (expanded on LINPACK, EISPACK)

### Modern variants?

Most default BLAS and LAPACK implementations (like R's defaults) are somewhat dated

- Written in Fortran and designed for a single cpu core
- Certain (potentially non-optimal) hard coded defaults (e.g. block size).

#### Multithreaded alternatives:

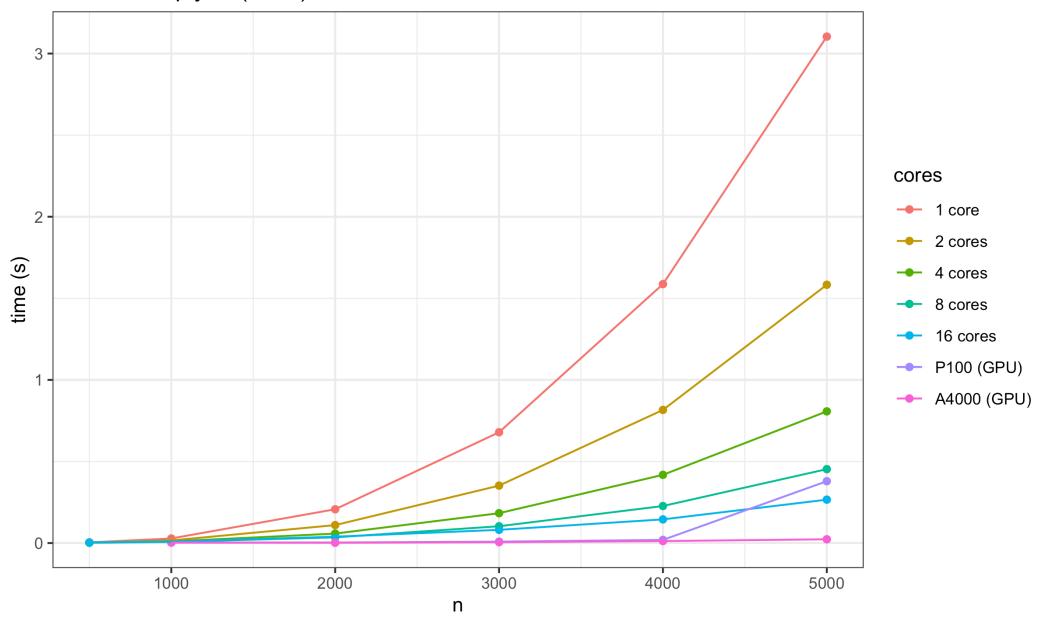

- ATLAS Automatically Tuned Linear Algebra Software
- OpenBLAS fork of GotoBLAS from TACC at UTexas
- Intel MKL Math Kernel Library, part of Intel's commercial compiler tools
- cuBLAS / Magma GPU libraries from Nvidia and UTK respectively
- Accelerate / vecLib Apple's framework for GPU and multicore computing

# **OpenBLAS Matrix Multiply Performance**
